

## Summary Report (Early Exit)

**Consultation Completed: 27th July 2017**

Mr Jones is a 63 year old man and has been on no asthma treatment. This is his 1<sup>st</sup> entry to the Lung Health software.

He was entered into the asthma management package on the presumption that the diagnosis was correct. Abnormal clinical findings:

- Trachea position deviated left
- Breath sounds abnormal (crackles - khj)

point to other possible explanations and so progress in the computerised package has been halted. No changes have been made to his clinical management.

Please ensure that either appropriate investigation of these abnormalities happens or that a doctor is happy to show they are unnecessary.

Please use your clinical judgment to manage the respiratory symptoms. As and when a doctor is able to authorise that it is appropriate to manage his asthma in a standard manner, then please re-enter him to the package.

### QOF Codes Reported

		5-Byte v2	CTV3	Value
<b>Asthma Register</b>				
<b>Reversibility</b>				
<b>RCP 3 Questions</b>	Asthma not disturbing sleep	663O	663O.	
	Asthma never causes daytime symptoms	663s	XaINa
